

WeatherPy Data Analysis

Objective: Visualize the weather of 500+ cities across the world of varying distance from the equator to illustrate what the weather is like as we approach the equator.

Observed Trends

- As we approach the equator, temperatures increase. Fig 1 shows temperatures at the equator concentrated around 70-85 degrees F. Similarly, temperatures start to gradually drop as we move further and further away from the equator (Fig 1).
- Although the list of cities was randomly generated, all the figures show cities concentrated in the Northern Hemisphere as expected, since the southern hemisphere has fewer cities.
- Figures 2, 3, and 4 show more scatter and no strong correlation between distance from equator and humidity, clouds, or wind.

```
In [1]: # Import Dependencies
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import requests as req
import time
import datetime
from citipy import citipy
import random
from config import openweathermap_api_key
from matplotlib import style
style.use('ggplot')
import warnings
warnings.filterwarnings('ignore')
```

Generate Cities List

```
In [2]: # Create empty df to store city data
city_df = pd.DataFrame()
# Create empty lists to store coordinates
lat = []
long = []
# Loop to generate random coordinates
for x in range(0,2500):
    lat.append(random.uniform(-90,90))
    long.append(random.uniform(-180, 180))
# Add generated coordinates to previously created df
city_df["Lat"] = lat
city_df["Long"] = long
#city_df
#city_df.count()

# Find cities corresponding to coordinates
# Create empty list to store city names
cities = []
# Loop to append city names
for index, row in city_df.iterrows():
    city=citipy.nearest_city(row["Lat"],row["Long"])
    cities.append(city.city_name)

# Add city names to previously created df
city_df['City'] = cities
#check Length to confirm
# print(len(city_df))
# Remove duplicates
city_df2 = city_df.drop_duplicates("City",keep="first")
# Confirm at Least 500 unique (non-repeat) cities in df
# city_df2.count()
```

Perform API Calls and Print Log

```
In [3]: # Create empty lists for weather data
temp = []
humidity = []
clouds = []
wind = []
counter = 0
url = "https://api.openweathermap.org/data/2.5/weather?"
units = "imperial"
# Iterate through the rows to pull data from API;
# Print log of each city as it's being processed with the city number, city
# name, and requested URL.
start = time.time()
print("-----Beginning Data Retrieval-----")
print("                                         ")
try:
    for index, row in city_df2.iterrows():
        counter +=1
        city = row["City"]
        query_url = url+"lat="+str(row["Lat"])+"&lon="+str(row["Long"])+"&a
ppid="+openweathermap_api_key+"&units="+units
        print("Now retrieving city number "+str(counter)+": city name => "+row["City"])
        print("Requested URL: "+query_url)
        print("-----")
        weather_response = req.get(query_url).json()
        temp.append(weather_response['main']['temp'])
        humidity.append(weather_response['main']['humidity'])
        clouds.append(weather_response['clouds']['all'])
        wind.append(weather_response['wind']['speed'])
        time.sleep(1)
except:
    pass
end = time.time()
print("-----Data Retrieval Complete-----")
print("                                         ")
print("                                         ")
run_time = round(end-start,0)
run_time_str = str(datetime.timedelta(seconds=(run_time)))
print("-----")
print("Total Time Elapsed for Loop Completion = "+run_time_str)
print("-----")
print("                                         ")
```
